

Sustainable Viticulture Declaration

VSPT Wine Group

1 People

We put people at the centre of our decisions, promoting a safe and healthy environment for all and thereby fostering their well-being and a better quality of life.

- We invest in our employees
- We support their technical and human development
- We implement innovations that allow us to improve processes and day-to-day work
- We also seek to maintain relationships of trust with the different members of the community by promoting local development in neighbouring communities.

2 Soils

We integrate practices and combine different tools that allow us to increase the biological life of our soils.

GOAL

improve their chemical and physical condition and biodiversity.

We are focused on increasing plant cover, integrated pest management and grazing in order to reduce our use of agrochemicals. We also use biofertilizers and compost made from the organic waste from our harvest.

3 Water

We are committed to working as precisely as possible in the use of water in our vineyards.

We measure each plant's needs using technology that allows us to know

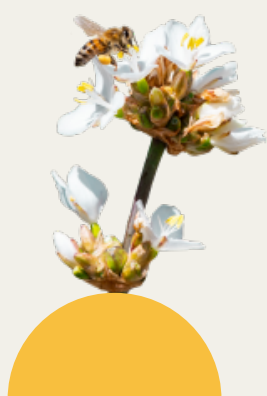

The climatic conditions

The water status of the plant

The moisture content in the solis

We integrate this information in order to define an irrigation strategy, which we apply through equipment that enables us to accurately measure the water inputs.

4 Biodiversity

We recognize the value of biodiversity in the development of sustainable viticulture. Likewise, we are aware of our impact and dependence on the ecosystem services that nature provides us

We are committed to maintaining a natural balance and taking care of native and endemic species.

5 Productivity & Efficiency

Our philosophy is based on achieving a high agricultural standard through a holistic approach that incorporates people, the vineyard and our environment, and promotes long-term productivity.

Making efficient use of the resources that we incorporate in our vineyards is a priority for us, so we avoid losses at all stages of the production cycle.

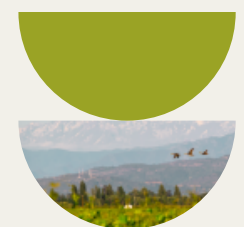

Likewise, we regard innovation as a way to incorporate best practices into our operation.

6 Renewable energy sources

We have solar energy in our main vineyards and we will continue to develop an energy matrix that allows us to decarbonize our production, in keeping with the objectives we have set ourselves as a company.

We will continue to search for projects that allow us to supply our own clean electricity.

7 Responsible sourcing

We are committed to the sustainable development of our grape and wine supply chain, so we will continue to provide tools and ongoing training to our suppliers.

We will also keep on implementing annual action plans that allow us to share our best practices and experiences, seeking to promote a common standard and strengthen long-term relationships.

8 Excellence & Compliance

We operate in full compliance with local regulations and the markets where we are present.

We rigorously follow up on our

COMMITMENTS AND CERTIFICATIONS

We seek excellence in each and every one of our processes.
